

CodeIgniter Assignment

Step 1 – Setup CI on your Machine.

Step 2 – Create a Database and link it to the above CI.

Step 3 – Create a Registration and Login Module. Frontend in Bootstrap, Backend with CI Framework, and do the CRUD operation on MySQL Database.

Condition – Registration will have five fields:

- a. First Name
- b. Last Name
- c. Email d. Password
- e. Type of users:
 - a. Employee
 - b. Dealer At the time of login, ask for your Email and Password.

Step 4 – If the User type is Dealer, then on the first login, ask them for City, State, and Zip code.

Step 5 – Allow Employee to view a list of Dealer and filter/search by Zip code.

Step 6 – Allow Employee and Dealer to edit Dealer's City, State, and Zip.

Note :

- Use javascript validation for forms.
- Use form validation in the controller function as well.
- During registration, it should not accept the email address already used. (Use ajax call).
- Use Ajax call to submit the form.
- For view pages use the '.html' extension rather than '.php' (Use JavaScript function if required).
- Registration forms should not accept incomplete mail IDs like synkrama@gmail.
- Show Success/Fail alerts.
- Use a valid variable name.
- Use server-side pagination.
